RFC 9500

Standard Public Key Cryptography (PKC) Test Keys

Abstract

This document provides a set of standard Public Key Cryptography (PKC) test keys that may be used wherever pre-generated keys and associated operations like digital signatures are required. Like the European Institute for Computer Antivirus Research (EICAR) virus test and the Generic Test for Unsolicited Bulk Email (GTUBE) spam test files, these publicly known test keys can be detected and recognised by applications consuming them as being purely for testing purposes without assigning any security properties to them.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Not all documents approved by the IESG are candidates for any level of Internet Standard; see Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9500>.

1. Introduction

The widespread use of public key cryptosystems on the Internet has led to a proliferation of publicly known but not necessarily acknowledged keys that are used for testing purposes or that ship preconfigured in applications. These keys provide no security, but since there's no record of them, relying parties are often unaware that they provide no security. In order to address this issue, this document provides a set of standard public test keys that may be used wherever a preconfigured or sample key is required and, by extension, also in situations where such keys may be used, such as when testing digitally signed data. Their purpose corresponds roughly to that of the European Institute for Computer Antivirus Research (EICAR) test file, a non-virus used as a test file for antivirus products, and the Generic Test for Unsolicited Bulk Email (GTUBE) file, a similar file used with spam-detection products.

The keys provided cover three major algorithm families:

- RSA

- algorithms based on the Discrete Logarithm Problem (DLP), such as DSA, Diffie-Hellman (DH), and Elgamal
- algorithms based on the Elliptic Curve Discrete Logarithm Problem (ECDLP), such as ECDSA and Elliptic Curve Diffie-Hellman (ECDH)

Although some of the algorithms and key sizes are no longer recommended, keys corresponding to those algorithms and key sizes are provided in order to accommodate the large installed base of existing implementations that use them.

This document does not try to cover every possible algorithm family and type since there are far too many of these and new ones are constantly appearing and, in some cases, disappearing. If similar documents are created for further algorithm families, they should update this document, and for ease of implementation and use, they should maintain compatibility with the format and naming conventions used here.

2. Publicly Known Test Keys

This section provides the test keys for the algorithm groups in various sizes in a C-like notation that may be directly used in crypto code written in C-like languages such as C, C++, Java, JavaScript, Go, Swift, and Rust, covering the majority of languages likely to be used to implement crypto code.

Alongside the source code format, they are also provided in encoded form, specifically the OpenSSL private key format, which many applications can process directly.

Each element of the key is given in a form consisting of a count in bits (the value from which the nominal key size is taken) followed by a byte string containing that key element in big-endian form. For example, the following is a sample key component for the RSA p value, where 0xCF is the most significant byte of the RSA p value and 0x03 is the least significant byte of the value:

```
/* p */
512,
{ 0xCF, 0xDA, 0xF9, 0x99, 0x6F, 0x05, 0x95, 0x84,
  0x09, 0x90, 0xB3, 0xAB, 0x39, 0xB7, 0xDD, 0x1D,
  [...]
  0xE1, 0x2C, 0x0D, 0xF7, 0x30, 0xE2, 0xB8, 0x09,
  0x73, 0x50, 0x28, 0xF6, 0x55, 0x85, 0x57, 0x03 },
```

In addition to the key data, each key is given a recommended name for use in source code as a means of providing a standard reference for each one.

2.1. RSA Keys

The following publicly known test keys may be used for RSA.

RSA-1024 key "testRSA1024":

2.3. ECDLP Keys

The following publicly known test keys may be used for ECDLP-based algorithms such as ECDSA and ECDH.

P256 key "testECCP256":

```
/* qx */
256,
{ 0x42, 0x25, 0x48, 0xF8, 0x8F, 0xB7, 0x82, 0xFF,
  0xB5, 0xEC, 0xA3, 0x74, 0x44, 0x52, 0xC7, 0x2A,
  0x1E, 0x55, 0x8F, 0xBD, 0x6F, 0x73, 0xBE, 0x5E,
  0x48, 0xE9, 0x32, 0x32, 0xCC, 0x45, 0xC5, 0xB1 },
/* qy */
256,
{ 0x6C, 0x4C, 0xD1, 0x0C, 0x4C, 0xB8, 0xD5, 0xB8,
  0xA1, 0x71, 0x39, 0xE9, 0x48, 0x82, 0xC8, 0x99,
  0x25, 0x72, 0x99, 0x34, 0x25, 0xF4, 0x14, 0x19,
  0xAB, 0x7E, 0x90, 0xA4, 0x2A, 0x49, 0x42, 0x72 },
/* d */
256,
{ 0xE6, 0xCB, 0x5B, 0xDD, 0x80, 0xAA, 0x45, 0xAE,

3. IANA Considerations

This document has no IANA actions.

4. Security Considerations

The intent of publishing known keys in this form is that they may be easily recognised as being test keys when encountered. It should go without saying that these keys should never be used or relied upon in production environments.

The authors await the inevitable Common Vulnerabilities and Exposures (CVEs).
